1. Explicación del método utilizado

Para la obtención de los datos deseados hemos realizado un script de bash que genera las tablas de datos y las gráficas con su correspondiente ajuste.

```
#!/bin/bash
1
   if [ $# -ne 1 ]
3
4
        echo "Uso: $0 <nombre>"
        exit 1
6
   fi
7
8
   # HEAPSORT
9
   g++ -std=c++11 ../src/heapsort.cpp
10
   nelementos=200
11
    echo "" > datos.dat
12
    while [ $nelementos -lt 10000 ]; do
13
        ./a.out $nelementos >> datos.dat
14
        let nelementos=nelementos+100
15
    done
16
17
   gnuplot ./gnuplot/heapsort.gp # Salida: "fichero.jpeg"

151
152
    # FLOYD
153
    g++ -std=c++11 ../src/floyd.cpp
154
    nelementos=200
155
    echo "" > datos.dat
156
    while [ $nelementos -lt 1000 ]; do
```

```
./a.out $nelementos >> datos.dat
158
        let nelementos=nelementos+10
159
    done
160
161
    gnuplot ./gnuplot/floyd.gp # Salida: "fichero.jpeg"
162
163
    mkdir ../Graficas/Floyd 2> /dev/null
164
    mkdir ../Graficas/Floyd/Datos 2> /dev/null
165
    mv fichero.jpeg ../Graficas/Floyd/floyd00_$1.jpeg
166
    mv datos.dat ../Graficas/Floyd/Datos/floyd00_$1.dat
167
    echo "Floyd completado"
168
169
    rm a.out
170
171
    rm fit.log
```

Para la obtención de las gráficas de forma directa utilizamos script de gnuplot que tienen la forma siguiente, en este caso adjuntamos "burbuja.gp".

```
set terminal jpeg
1
   set output "fichero.jpeg"
2
3
   set title "Eficiencia burbuja"
4
   set xlabel "Tamano del vector"
5
   set ylabel "Tiempo (s)"
   set fit quiet
7
   f(x) = a*x*x+b*x+c
   fit f(x) "datos.dat" via a, b, c
9
   plot "datos.dat", f(x)
```

Los diferentes ajustes se han conseguido así:

```
f(x) = a*x*x*x+b*x*x+c*x+d
g(x) = a*x*x+b*x+c
h(x) = a*x*(log(x)/log(2))
i(x) = a*(((1+sqrt(5))/2)**x)
```

1.1. Comparativa entre diferentes ordenadores

Para conseguir las gráficas con todos los datos hemos usado otro script de bash.

```
\#!/bin/bash
1
   for DIR in 'ls Graficas/'; do
2
      if [ $DIR != Ajustes ] && [ -d Graficas/$DIR ]
3
4
        archivo="temporal.gp"
5
6
        echo "set terminal jpeg" > \$archivo
7
        echo "set output \"fichero.jpeg\"" >> $archivo
8
        echo "set title \"Eficiencia $DIR\"" >> $archivo
9
        echo "set xlabel \"Tamano del vector\"" >> $archivo
10
        echo "set ylabel \"Tiempo (s)\"" >> $archivo
11
        echo "set fit quiet" >> $archivo
```

```
echo "unset key" >> $archivo
13
14
        num=0
15
        dir="Graficas/$DIR/Datos"
16
17
        for FILE in 'ls $dir'; do
18
          if [ $DIR == Burbuja ] || [ $DIR == Insercion ] || [ $DIR == Seleccion
19
              ]
            then
20
            echo "fnum(x) = a*x*x+b*x+c" >> $archivo
21
            echo "fit f$num(x) \"$dir/$FILE\" via a, b, c" >> $archivo
22
          elif [ $DIR == Mergesort ] || [ $DIR == Quicksort ] || [ $DIR ==
23
             Heapsort ]
            then
24
            echo "fnum(x) = a*x*(log(x)/log(2))" >> $archivo
25
            echo "fit f$num(x) \"$dir/$FILE\" via a" >> $archivo
26
          elif [ $DIR == Fibonacci ]
27
            then
28
            echo "fnum(x) = a*(((1+sqrt(5))/2)**x)" >> $archivo
29
            echo "fit f$num(x) \"$dir/$FILE\" via a" >> $archivo
30
          elif [ $DIR == Floyd ]

3. Gráficas

3.1. Ordenaciíon

En este apartado compararemos 6 algoritmos diferentes de ordenación dentro de un vector. Cada algoritmo lleva su ajuste correspondiente.

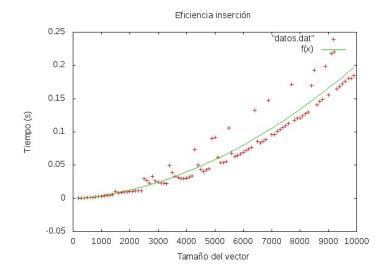

3.1.1. Burbuja

$$f(x) = a \cdot x^2 + b \cdot x + c \implies \begin{cases} a = 4,31433 \cdot 10^{-9} \pm 2,378 \cdot 10^{-10} (5,511\%) \\ b = 3,94506 \cdot 10^{-6} \pm 2,476 \cdot 10^{-6} (62,75\%) \\ c = -0,00311235 \pm 0,005425 (174,3\%) \end{cases}$$

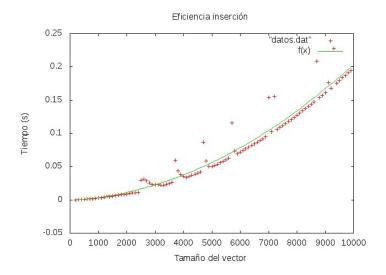

3.1.2. Inserción

$$f(x) = a \cdot x^2 + b \cdot x + c \implies \begin{cases} a = 2,36229 \cdot 10^{-9} \pm 2,503 \cdot 10^{-10} (10,6\%) \\ b = -2,27723 \cdot 10^{-6} \pm 2,606 \cdot 10^{-6} (114,5\%) \\ c = 0,00096037 \pm 0,005712 (594,8\%) \end{cases}$$

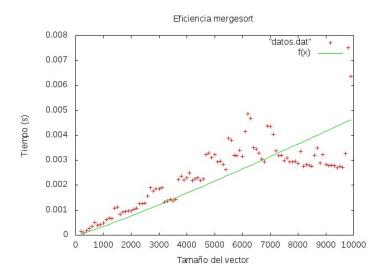

3.1.3. Selección

$$f(x) = a \cdot x^2 + b \cdot x + c \implies a = 2{,}36327 \cdot 10^{-9} \pm 3{,}232 \cdot 10^{-11} (1{,}368\,\%)$$

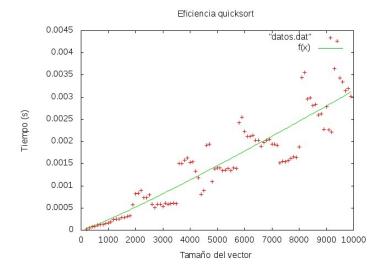

3.1.4. Mergesort

$$f(x) = a \cdot x \cdot log_2(x) \implies a = 3.5231 \cdot 10^{-8} \pm 1.191 \cdot 10^{-9} (3.382\%)$$

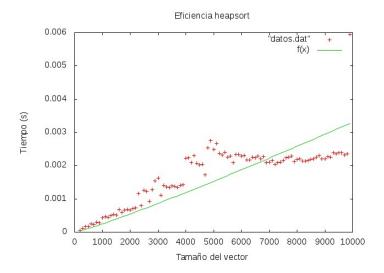

3.1.5. Quicksort

$$f(x) = a \cdot x \cdot log_2(x) \implies a = 2,3704 \cdot 10^{-8} \pm 5,497 \cdot 10^{-10}(2,319\%)$$

3.1.6. Heapsort

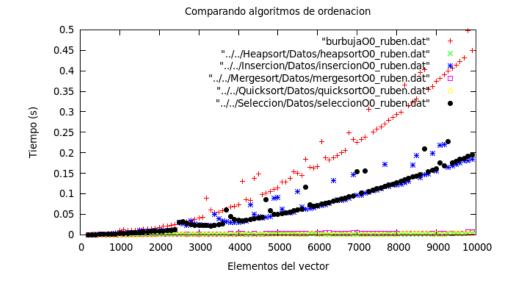

$$f(x) = a \cdot x \cdot log_2(x) \implies a = 2,49016 \cdot 10^{-8} \pm 7,983 \cdot 10^{-10}(3,206\%)$$

3.1.7. Comparativa algoritmos de ordenación

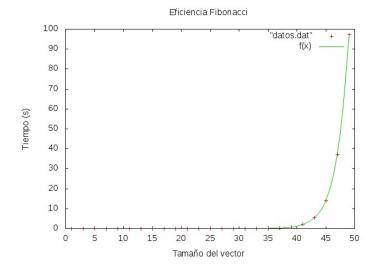

En este apartado comprobamos empíricamente las diferencias de eficiencia entre diferentes algoritmos de ordenación de un vector. Se observa una diferencia notable entre los algoritmos $O(nlog_2(n))$ y los $O(n^2)$, casi no se aprecian los primeros.

También nos percatamos de la diferencia dentro de los mismos algoritmos con eficiencia $O(n^2)$, debido a la constante multiplicativa que los acompaña, inserción y selección son parecidos y burbuja tarda bastante más que los anteriores.

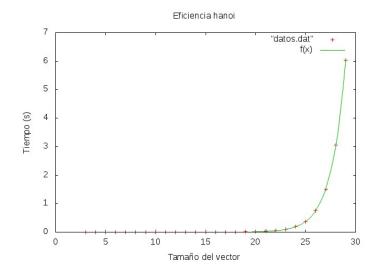

3.2. Fibonacci

$$f(x) = a \cdot ((1 + \sqrt{(5)})/2)^x \implies a = 5,59738 \cdot 10^{-9} \pm 2,093 \cdot 10^{-12}(0,0374\%)$$

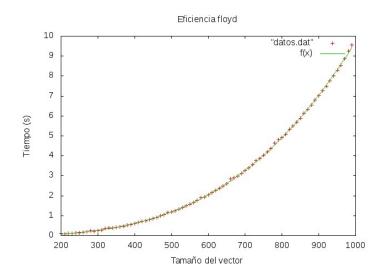

3.3. Hanoi

$$f(x) = a \cdot (2^x) \implies a = 1,12636 \cdot 10^{-8} \pm 1,391 \cdot 10^{-11}(0,1235\%)$$

3.4. Floyd

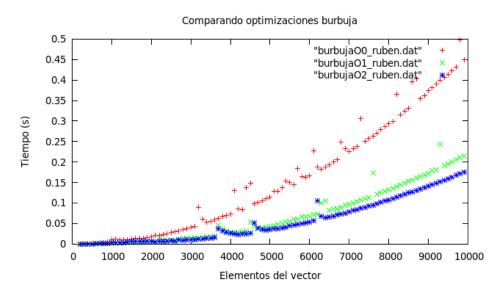

$$f(x) = a \cdot x^3 + b \cdot x^2 + c \cdot x + d \implies \begin{cases} a = 1,11725 \cdot 10^{-8} \pm 3,725 \cdot 10^{-10} (3,334\%) \\ b = -2,27723 \cdot 10^{-6} \pm 6,692 \cdot 10^{-7} (29,39\%) \\ c = 0,00096037 \pm 0,0003713 (38,66\%) \\ d = -0,115743 \pm 0,06234 (53,86\%) \end{cases}$$

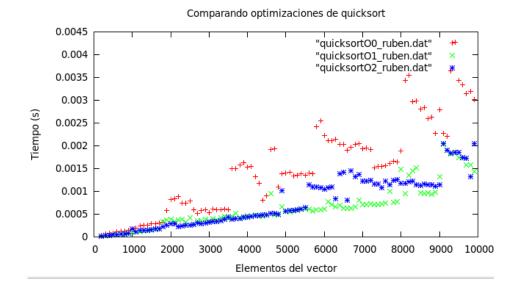

3.5. Optimización de algunos algoritmos

Como podemos comprobar, por mucho que optimicemos el algoritmo de burbuja no llega a igualarse al mejor algoritmo de ordenación (en término medio), quicksort. La optimización más agresiva sin riesgo de pérdida de información es -O2 y llega a ser 10 veces más lento que quicksort sin optimización (con 10.000 elementos).

Esto es una prueba gráfica de que hay que tener en cuenta la eficiencia de los algoritmos, ya que la mejora hardware no es suficiente en caso de que tengamos restricciones de tiempo.

Una observación curiosa es que el algoritmo Quicksort realmente es un algoritmo con eficiencia en el caso peor de $O(n^2)$, ya que si le pasamos un vector que está ordenado es cuadrático. Por otro lado Heapsort es un $O(nlog_2(n))$ puro, pero en término medio es peor que Quicksort, ya que los datos que se suelen pasar a estos algoritmos no están ordenados.

Después de comparar dichos algoritmos de ordenación optimizaremos el algoritmo floyd, tipo de algoritmo con programación dinámica para encontrar el camino mínimo en grafos ponderados.

3.6. Diferentes ordenadores

Si ejecutamos el mismo programa en diferentes ordenadores este será el resultado.

4. Ordenador usado para la ejecución

HP Pavilion g series (Pavilion g6) Sistema operativo: ubuntu 14.04 LTS

Memoria: 3.8 GiB (4Gb)

Procesador: Inter Core i
3-2330 M
 CPU @ 2.20 GHz x
 4

Gráficos: Intel Sandybridge Mobile

Tipo de SO: 64 bits Disco: 487.9 GB
